## DRAFT Adaptation Pathways

As time passes the risk of flooding at Leithfield Beach is going to increase. In the long term a more substantial option may be required to address the risk. In the short term there are some options we can implement to reduce the risk. These options are identified in the [pathways](#) map below.

Do you agree with the options identified in the draft Adaptive Planning Pathway?

Of the options above, do you have a preferred pathway?

## Implementation

We want to keep as many options on the table as possible until it's time to act but it's important we act before the risk of the hazard becomes too great. Triggers are proposed to track how the hazards are changing. These are indicators that the current situation is worsening to the point it's no longer acceptable. The proposed triggers are set out on pages 19-21 of the Coastal Adaptation Plan and are summarised below.

## Actions

Actions to support the delivery of the Adaptation Plan are set out in pages 23 and 24 of the Leithfield Beach Coastal Adaptation Plan.

[Leithfield Beach Coastal Adaptation Plan](#)

One of the proposed actions is to introduce a small, targeted rate within Leithfield Beach to fund the construction of an inundation bund if required in future. At the current time, the cost of a bund is estimated to be approximately \$160 per property per year over a 20-year period. This contribution could start smaller at \$20-\$50 per year and increase over time as the need becomes more urgent.

**Are you willing to pay an annual targeted rate towards a future inundation bund?**

- Yes
- No

**How much would you be willing to contribute annually towards funding an inundation bund?**

- Not willing to contribute
- \$20
- \$30
- \$40
- More than \$50

**Are there other actions you would like recorded as part of the plan?**

**General comments or request changes**
